A Guide to Collaborating on FlutterFlow Projects

Welcome to the team! In FlutterFlow, sharing your work and building apps collectively is seamless. This guide outlines how project sharing works, how to invite external users, how to hand over project ownership, and how real-time teamwork functions.

1. What is Project Collaboration?

To effectively collaborate, you need to understand the structural types of projects, external access options, and visibility tools available in FlutterFlow:

- **Team Projects:** Open workspaces accessible to everyone in your organization. All members automatically join as Editors, though they can be manually downgraded to Viewers.
- **Restricted Team Projects:** Private workspaces hidden from the rest of the organization until specific team members are manually selected and added.
- **Personal Projects:** Private, isolated workspaces dedicated solely to you. Your editing capabilities depend entirely on your personal subscription plan.

- **Collaborator Pass:** A paid add-on that grants an external user (like a contractor or client) full Editor access to a specific project within your team workspace.
- **Project Activity Log:** A running history of edits that tracks who made what changes over time, providing visibility into overall project progress.

FlutterFlow Sharing Roles at a Glance

Role	Access Level	Best For	Cost

Viewer	Read-Only	Clients, stakeholders, and design sign-offs.	**Free** (All plans)
Editor	Full Edit Access	Internal developers and active builders.	Included in **Growth/Enterprise**
External Editor	Full Edit Access	Freelancers or external agency partners.	Requires **Collaborator Pass**
Owner	Administrative Control	Project leads or the primary client entity.	Included in paid plans

2. Why use FlutterFlow Collaboration Features?

Utilizing these collaboration frameworks provides the control and security necessary for professional app development:

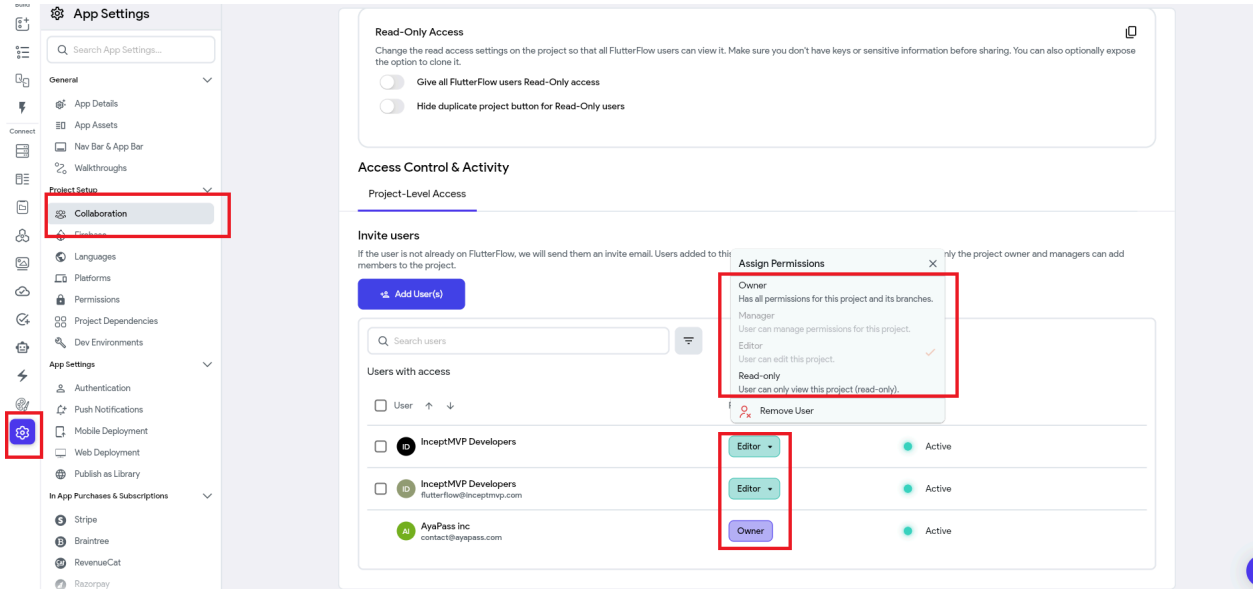

- **Security & IP Protection:** By using *Restricted Team Projects*, you ensure sensitive or unannounced client projects remain invisible to unauthorized internal staff.
- **Cost Efficiency:** *Read-Only* access is free, allowing you to loop in unlimited clients for feedback without inflating your software bill.
- **Seamless Handovers:** Native ownership transfers allow you to seamlessly hand off a completed app directly to a client's corporate FlutterFlow account.
- **Accountability:** The *Project Activity Log* removes the guesswork from team management, showing you exactly who modified the app and when.

3. How to Manage Workspace Collaboration

Sharing & Managing Access

1. **Internal Sharing:** Navigate to your project's **Collaboration settings** and utilize the **Share with team** dropdown menu to toggle between *Team*, *Restricted*, or *Personal*.
    - *Note:* Team sharing features require a **Growth plan or higher**.
    - *Note:* The designated **Team Owner** always maintains full administrative control over every project, regardless of who originally created it.

2. **External Sharing:** Invite external stakeholders via the email invite field.
    - **For Viewers:** Type their email and assign "Read Only".
    - **For External Editors:** The Team Owner must purchase a **Collaborator Pass**. The recipient must already have an active paid FlutterFlow plan (Basic, Growth, or Business) and verify their email to clear their "Pending" status.
    - *Note:* "Library" projects cannot be converted into Restricted team projects.

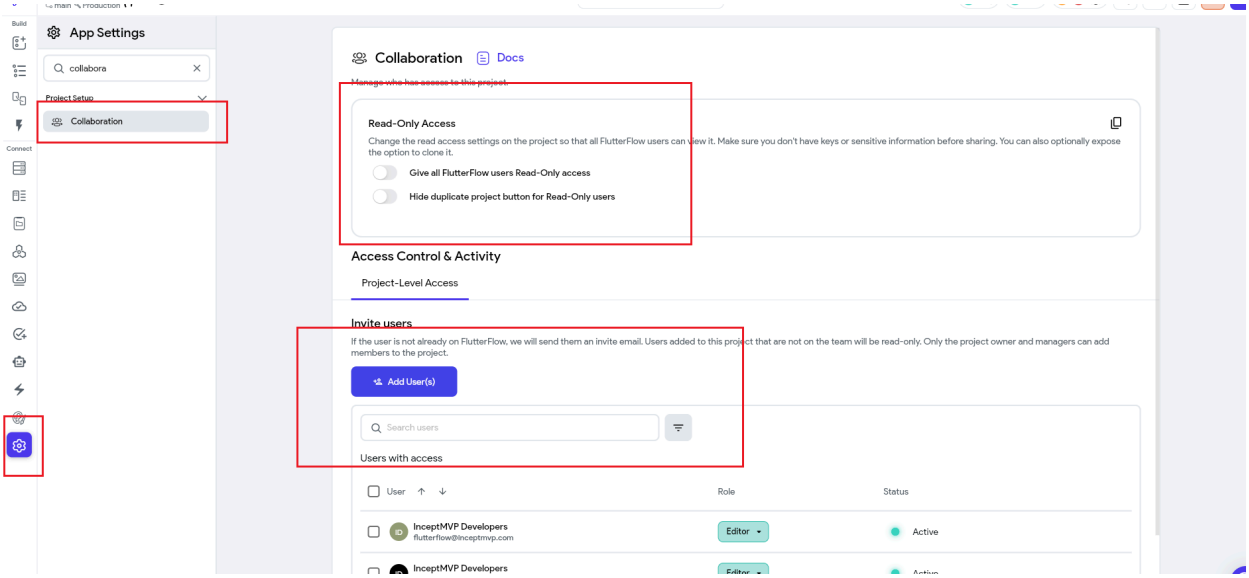

Transferring Project Ownership

When a project is fully completed and ready for final offboarding:

1. Navigate to **Settings & Integrations > Project Setup > Collaboration > Project-Level Access**.
2. Locate the recipient's name, click their current role dropdown, and select **Owner**.
3. ⚠️ **Warning:** This action is immediate and **cannot be undone**. You will instantly lose control of the project. The recipient must have an active paid plan to accept ownership.

Real-Time Live Development

- **Co-Editing:** If your team is on a **Growth plan or higher**, multiple developers can build on the exact same page simultaneously. You will see live mouse cursors and modifications in real time without workspace interruption.
- **Reviewing History:** To audit project history, access the **Project Activity Log**.
    - *Note:* This history tracking is an exclusive premium feature available only to **Enterprise** workspaces.

Docs
Manage who has access to this project.
Read-Only Access
Change the read access settings on the project so that all FlutterFlow users can view it. Make sure you don't have keys or sensitive information before sharing. You can also optionally expose the option to clone it.
Give all FlutterFlow users Read-Only access
Hide duplicate project button for Read-Only users
Access Control & Activity
Project-Level Access
Invite users
If the user is not already on FlutterFlow, we will send them an invite email. Users added to this project that are not on the team will be read-only. Only the project owner and managers can add members to the project.
